

# Deep Learning Crossword

## Down

- 1 Technique to prevent overfitting by penalisation.
- 2 Learning without labelled data.
- 3 Distinct characteristics learned by a model.
- 5 Learning with labelled data.
- 6 Algorithm for computing gradients wrt parameters. \_\_\_\_propagation.
- 7 Vector of partial derivatives used to update model parameters.
- 9 A method for removing unnecessary weights from a neural network.
- 10 One complete pass through the entire training dataset.
- 12 Simplest type of neural network.
- 14 Something you do to a dataset to artificially increase its size.
- 16 Operation that reduces spatial dimensions by summarising local regions.
- 18 A group of training examples processed together.
- 21 Commonly used activation function, with a continuous gradient.
- 22 Commonly used activation function, with a discontinuous gradient.

## Across

- 3 Adjusting pre-trained models for a specific task.
- 4 Quantifies the difference between predicted and actual values.
- 8 A parameter whose value is set before the training process.
- 11 Combines forward pass, compute gradients, update weight. Training \_\_\_\_.
- 13 Occurs when a model learns noise instead of patterns.
- 15 Additional parameters in neural networks, accounting for offset.
- 16 Technique of adding extra pixels to the input boundary.
- 17 Raw classification score before applying sigmoid or softmax.
- 19 Regularisation technique to prevent overfitting.
- 20 Regularisation that shrinks weights towards zero. Weight \_\_\_\_.
- 21 Multidimensional data structure used in deep learning.
- 23 CNNs \_\_\_\_\_ the kernel with the input image.
